

Lockdown

Lockdown group permissions per namespace.

The **Lockdown** extension implements a way to restrict access to specific namespaces and special pages to a given set of user groups. This provides a more finely grained security model than the one provided by the default [\\$wgGroupPermissions](#) and [\\$wgNamespaceProtection](#) settings.

The following pages about the security model used by MediaWiki per default may be helpful to understand the instructions below:

- [Manual:User rights](#)
- [Manual:\\$wgGroupPermissions](#)

Managing groups

You can control which user belongs to which groups with the page [Special:Userrights](#). Only existing groups will be proposed, but you can "create" a new group by creating an entry for it in [Manual:\\$wgGroupPermissions](#) (even if you don't actually need to set a permission there, but it has to appear on the left hand side of the array).

For more information please visit [MediaWiki](#).

Lockdown	
implements per-namespace group permissions.	
Status:	stable
Developer:	Daniel Kinzler
Extension type:	MediaWiki
Edition:	BlueSpice free
Dependencies:	MediaWiki
