## Revision as of 11:47, 9 August 2023

For a trouble-free installation of the current version of BlueSpice 4, we recommend the following system requirements.

### Browser

- Microsoft Edge
- Google Chrome
- Firefox

### Server Environment

- **Operating system:**
  - We strongly recommend Linux (preferably Debian 11, Ubuntu 22.04, CentOS 7)
  - You might use Windows Server starting at 2016, but we have seen performance issues on Windows Server
- **Webserver:**
  - Apache 2.4.x, IIS >= 10 *or* nginx 1.x (*nginx not possible in WikiFarm*)

- **PHP:**
  - PHP 7.4: BlueSpice 4.2.x runs completely stable
  - PHP 8.0: Starting with BlueSpice 4.2.4
  - PHP 8.1 / PHP 8.2: Starting with BlueSpice 4.3.x
- **Database:**
  - MySQL:  $\geq 5.6$  or
  - MariaDB  $\geq 10.3$
- **(Virtual) hardware requirements:**
  - **CPU:**
    - **Linux: 8 Cores** (min. 4 Cores)
    - Windows: 16 Cores (min. 8 Cores)
  - **Main memory:**
    - **Linux: 16 GB** (min. 8GB)
    - Windows: min. 16 GB
  - **Available hard drive space:**
    - $> 20$  GB (depends on the planned storage of data)
- **Other:**
  - Apache Tomcat  $\geq 9$  oder Jetty  $\geq 9$  (for PDF export and LaTeXRenderer)
  - Elasticsearch 6.8 with plugin "ingest-attachment"
  - OpenJDK  $\geq 10$
  - NodeJS 16
