## Scope and terminology

---

Semantic MediaWiki (SMW) is a MediaWiki extension that enables you to define and query data on a wiki page.

The following steps are usually taken to work with data-based content in your wiki :

1. **Define properties:** Properties determine which values can be queried in the wiki.
2. **Create a template:** This creates the output format of the data set on the wiki pages.
3. **Create a form:** Using this form, Wiki users can comfortably enter their data.
4. **Assign a category:** Each page that contains a semantic query is usually tagged with a category that was created for this purpose. This, in addition to the attributes, provides an important means of querying and filtering the pages. It also creates a form editing mode for the wiki pages that contain this category.

## Properties

### List of properties

---

1. Has First contact + 🔍 of type [Date](#) (0 uses) ⓘ
2. Has contact person + 🔍 of type [Text](#) (0 uses) ⓘ
3. Has location + 🔍 of type [Text](#) (0 uses) ⓘ

#### Semantic properties

## Template

<b>Location</b>	Regensburg
<b>Contact</b>	Jane Doe
<b>First contact</b>	2020/12/21

Hallo Welt! was founded to make the technology and concept

Since 2007 Hallo Welt! builds collaborative platforms of knowl  
online documentation and quality management.

#### Semantic template

## Form

**Location:**

**Contact person:**

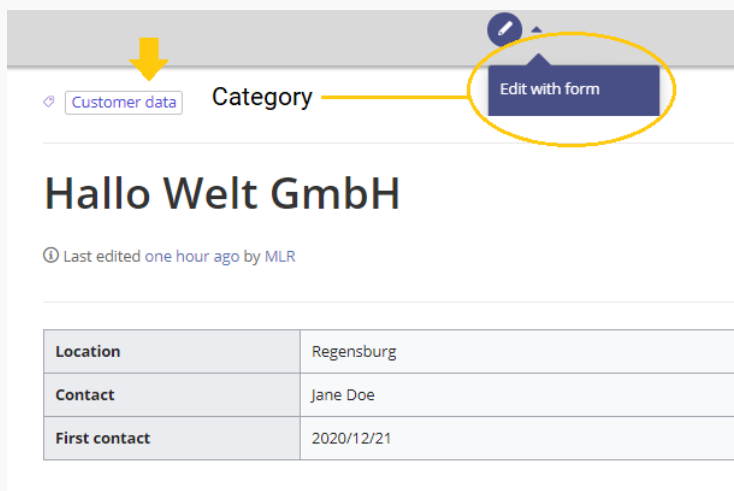

**First contact:**  

### Free text:

Hallo Welt! was founded to make the technology and concept c

Since 2007 Hallo Welt! builds collaborative platforms of knowle  
management, online documentation and quality management.

## Data entry form

The screenshot shows a data entry form for 'Hallo Welt GmbH'. At the top, there is a grey header bar with a yellow arrow pointing down to a 'Customer data' tab and a blue 'Edit with form' button circled in yellow. Below the header, the title 'Hallo Welt GmbH' is displayed, followed by a note 'Last edited one hour ago by MLR'. A table below contains the following data:

Location	Regensburg
Contact	Jane Doe
First contact	2020/12/21

## Category to organize data

## Define properties

To make information available as data on a wiki page, we create so-called **properties**. For example, if we want to semantically record customer data, we create a wiki page for each customer. We collect customer data such as location on every customer page. To do this, we create a property that records the location of the customer.

```
[[Has location::Regensburg]]
```

Afterwards I can list all customers at a certain location or all customers with their associated locations in the wiki.

## Create a template

Since we often want to display several such properties and their values on one page at the same time, we format a special area that clearly shows the collected page attributes. This requires a (data) template, which can then be used on any wiki page.

Location	Regensburg
Contact	Jane Doe
First contact	2020/12/21

Data template

## Create a form

To support our users with data entry tasks, we create an input form. The input form is shown when users switch to the edit mode of a wiki page that has the semantic template included.

Location:	<input type="text" value="Regensburg"/>
Contact person:	<input type="text" value="Jane Doe"/>
First contact:	<input type="text" value="21/12/2020"/> 

Data entry form

## Assign a category

---

Wiki pages that use semantic templates are tagged with a category. This category enables the assignment of the input form to the wiki page. The category is also used to query the data collected via the template and display it anywhere in the wiki.

## Example

---

On the following pages, we will create an example that collects and displays customer data it in the wiki.

### Example: Collect customer data
