As soon as the setup of BlueSpice is completed, you should prevent the execution of the `installcheck.php` while using the wiki productively.

A short instruction can be found in this document.

## Tips for this Document

---

Please, read this manual completely and work through the single installation steps one after another. For editing the configuration files with a text editor, the files must be saved in UTF-8 coding without BOM (Byte Order Mark).

The placeholder `<installpath-bluespice>` stands for the path to your BlueSpice installation, e.g. `C:\inetpub\wwwroot\bluespice` (Windows) or `/var/www/bluespice` (Linux).

## Deactivating `installcheck.php`

---

Switch to the directory `<installpath-bluespice>` and open the `installcheck.php` file in a text editor.

```
Insert a new line after the first line and insert
```

```
die( 'Deactivated.' );
```

Save and exit the file. The `installcheck.php` is no longer accessible now.

If you need to restore this file at a later time, it is sufficient to temporarily disable inserted line by placing the `#` character at the beginning of the line.
