## Transclusion

---

### What is a transclusion?

---

Transclusion means the inclusion of the content of one page (the transclude) in the content area of another page. Most often, templates are used to achieve a transclusion. If the content of the transclude is changed, the alteration is visible on all sites containing the transclusion.

### Scope of application

---

By using transclusions, you can **maximize the consistency** in your wiki, **minimize redundancy**, and **optimize your workflows and code**. The use of transclusions is especially indicated for the following cases:

- Banner: It will be displayed on other pages through transclusion

- Table: Parts of it or whole tables will be displayed on other pages through transclusion

### The functions of transclusions

---

To use a transclusion, the transclude has to be implemented on the target page by entering the transcludes name in curly braces.

```
{{Transclude}}
```

This causes the target page to show the content of the transclude. Future changes made on the transclude will also appear on the target page.

### Transclusions with Parameters

---

It is possible to use both named and unnamed parameters with transclusions.

### Partial transclusion

---

By using the tags "noinclude", "onlyinclude" and "includeonly" it is possible to only transclude parts of a document.

- `<noinclude>...</noinclude>`
- Allows to exclude the content between the tags of the transclusions
  - `<includeonly>...</includeonly>`
- Allows to transclude the content between the tags, but doesn't show them on the transclusion template.
  - `<onlyinclude>...</onlyinclude>`
- Allows only to transclude the content between the tags.
