This document describes the steps for the installation of MediaWiki 1.27.4 and BlueSpice 2.27.3 with installer.

⚠️ **Please note that this installation guide does only work with the edition BlueSpice free!**

### Tip for this Document

- Please, read this manual completely and work through the single installation steps one after another.
- For editing the configuration files with a text editor, the files must be saved in UTF-8 coding without BOM (Byte Order Mark).
- The placeholder `<installpath-bluespice>` stands for the path to your BlueSpice installation, e.g. C:\inetpub\wwwroot\bluespice (Windows) or /var/www/bluespice (Linux).
- The placeholder `<bluespice-url>` stands for the URL to your future BlueSpice installation, e.g. http://localhost/bluespice.
Requirements

Web server

The system must already be running a Web server (IIS / Apache) that is configured to access <bluespice-url>.

PHP

PHP must be embedded in the web server. Ensure that the following modules are enabled:

- php-curl
- php-gd
- php-tidy

MariaDB/MySQL

A database server (MariaDB oder MySQL) must be set up and available. You need administrative access (root).

Download BlueSpice

Download the current version of BlueSpice directly at Sourceforge. The package is named BlueSpice-free-2.27.3.zip.

Unzip and Copy BlueSpice

Unzip the downloaded archive with BlueSpice. Note that the relevant content is located in the subfolder "bluespice-free-installer". Move the complete content to <installpath-bluespice> and integrate it into existing folders.

Renaming of Relevant Folders

Rename the following folders in <installpath-bluespice> as follows:

- extensions/BlueSpiceFoundation/data.template
  --> extensions/BlueSpiceFoundation/data
- extensions/BlueSpiceFoundation/config.template
  --> extensions/BlueSpiceFoundation/config

Adjusting File System Permissions

Make sure that the following folders in <installpath-bluespice> are accessible and writable by the webserver:

- cache
- images
Detailed information about the file system permissions can also be found in our installation manual at the security settings.

Starting the installation

Open <bluespice-url> in your browser. You should get the start page for installation:

Continue by clicking "set up the wiki".

Language selection

You will be asked for the language during the installation process and the system language of your installation.

Select the required language and click "Next".
If you want to run your Wiki in German, please note that you have the choice between informal ("de") and formal ("de-formal") mode.

Checking the Installation Environment

The following page should allow you to skip with "Next" in most cases. If errors (red font) are displayed, there is a need for action at your server environment. Please do the necessary corrections.

Database Settings

On the following page, you will be prompted to enter your database settings.

- If the database server is on the same PC as the MediaWiki installation, please do not use "localhost" but "127.0.0.1".
- The database itself is created in the further process if it does not already exist. You do not have to create the database in advance.
- The database table prefix does not have to be specified. This only makes sense if you need the database for other database tables than for your MediaWiki installation.
- Please enter the user name and password of the administrative database user (usually root).

Click "Next".

On the second page about the database it is recommended to create your own database user for your installation. Deactivate the checkbox "Use the same database account as during the installation process" and enter a username and password of your choice. Activate the checkbox "If not already existing, you have to create the account now".
Then click "Next".

**Wiki Settings**

Now enter a name of your choice for your wiki. You can also define an administrative user and his password here. You can change the email address of this user at any time in the user settings. Leave all the other settings as they are and click "Next".
Extended Settings

The settings on the now displayed page should be set as shown in the following screenshot. Please adjust the email address according to your needs, the paths in the section "Uploading Images and Files" are automatically filled and should be left as they are.

At this point, no MediaWiki standard extensions will be chosen. The necessary extensions for BlueSpice will be integrated during the BlueSpice setup.

Then click on "Next". Also confirm the following pages with "Next".

All necessary settings are made now. Please confirm with "Next" again.
Deposit LocalSettings.php

Finally, the "LocalSettings.php" will be provided for downloading it. Please do this and move the file to <installpath-bluespice>.

Checking the Installation Requirements

Call up the file installcheck.php at <bluespice-url> in your browser (example: http://localhost/installcheck.php). Correct all red (error) and ideally yellow (warning) declared messages (mostly in the php.ini) like specified. Please note, that changes in the php.ini may require a restart of the webserver. Do not continue until you have been able to remove at least all errors (red).

Check Installation

Call <bluespice-url> in your browser. BlueSpice should now be successfully installed and a login with your access data should be possible.
Further configuration

Your BlueSpice installation is now ready to use. You can also do some further configuration:

- Setup of the extended search
- Setup of the PDF export

Also, some security settings are recommended.
1.1. File System Permissions

For trouble-free usage of your BlueSpice installation, the web server requires write permissions to several folders of the file system. However, it is recommended to keep the rights for all other files and folders to a minimum. This document shows you the relevant folders and the correct permissions setting.

Tips for this Document

- Please, read this manual completely and work through the single installation steps one after another.
- For editing the configuration files with a text editor, the files must be saved in UTF-8 coding without BOM (Byte Order Mark).
- The placeholder stands for the path to your BlueSpice installation, e.g. `C:\inetpub\wwwroot\bluespice` (Windows) or `/var/www/bluespice` (Linux).

Affected Folders

The folders, which require write permissions, are:

- `<installpath-bluespice>/cache`
- `<installpath-bluespice>/images`
- `<installpath-bluespice>/extensions/BlueSpiceFoundation/config`
- `<installpath-bluespice>/extensions/BlueSpiceFoundation/data`
- `<installpath-bluespice>/extensions/Widgets/compiled_templates` (only BlueSpice pro)

Assignment of Permissions with Windows

Assign "change" rights for this folder for the local user "Everyone".
Assignment of Permissions with Linux

Here you can assign rights much more strictly, which is also recommended. Transfer the directory `<installpath-bluespice>` recursively to the user root (CHMOD for Files 644, CHMOD for Directories 755) and after this, transfer the mentioned directory recursively to the user and the group, under which the Apache Web Server runs (Debian/Ubuntu e.g. "www-data").

In the following, we provide a bash script, which works through this tasks for you with only one command.

To do so, create the file `/usr/local/bin/setWikiPerm` and copy the following code into this file:

```bash
#!/bin/bash

WWW_USER="www-data"
WWW_GROUP="www-data"
WWW_HOME=`eval echo ~$WWW_USER`
WWW_CFG=$WWW_HOME/.config

if [ $# -eq 0 ]; then
    echo "You must enter the path of your MediaWiki installation."
    exit 1
fi

full_control="true"
modify="true"
read_execute="true"
list_folders="true"
read="true"
write="true"

# Set permissions
chmod 755 $WWW_HOME
chmod 644 $WWW_HOME
```
echo "You must enter the path of your MediaWiki installation." 
exit 
elif [ ! -d $1 ]; then 
  echo "$1 does not exist or is no path." 
  exit 
fi 
PATH=`echo "$1" | sed -e 's#/$##'` 
/usr/bin/find $PATH -type d -exec /bin/chmod 755 {} \; 
/usr/bin/find $PATH -type f -exec /bin/chmod 644 {} \; 
/bin/chown -R root:root $PATH 
pathes=( 
  "$PATH/cache" 
  "$PATH/images" 
  "$PATH/_sf_instances" 
  "$PATH/extensions/BlueSpiceFoundation/data" 
  "$PATH/extensions/BlueSpiceFoundation/config" 
  "$PATH/extensions/Widgets/compiled_templates" 
) 
for i in "${pathes[@]}"; do 
  if [ -d $i ]; then 
    /bin/chown -R $WWW_USER:$WWW_GROUP $i 
  fi 
done 
if [ ! -d $WWW_CFG ]; then 
  /bin/mkdir $WWW_CFG 
fi 
/bin/chown -R $WWW_USER:$WWW_GROUP $WWW_CFG 
/bin/chmod 755 $PATH/extensions/SyntaxHighlight_GeSHi/pygments/create_pygmentize_bundle 
/bin/chmod 755 $PATH/extensions/SyntaxHighlight_GeSHi/pygments/pygmentize 
/usr/bin/find $PATH/extensions/Scribunto.engines/LuaStandalone/binaries/*_linux_* -name ' 

If needed, replace the content of the variables 

WWW_USER="www-data" 
WWW_GROUP="www-data" 

with the appropriate user and group of your distribution.

After this, assign CHMOD 755 to this file. Now you can run the script and let it do the complete permission setting automatically with the following command:

```bash 
setWikiPerm <installpath-bluespice> 
```

**Note that when the update.php is executed on the console, the rights can be partially discarded. For this reason, set the rights to "update.php" again.**
2. Configuration of the webservices

- Extended Search
- PDF-Export
- VisualDiff *(BlueSpice pro only)*
- LatexRenderer *(BlueSpice pro only)*
This document describes the installation of the extended search for BlueSpice. Please take into account, that the Apache Tomcat server must be installed and configured completely.

Tips for this Document

- Please, read this manual completely and work through the single installation steps one after another.
- For editing the configuration files with a text editor, the files must be saved in UTF-8 coding without BOM (Byte Order Mark).
- The placeholder `<installpath-bluespice>` stands for the path to your BlueSpice installation, e.g.: `\inetpub\wwwroot\bluespice` (Windows) or `/var/www/bluespice` (Linux).
- The placeholder `<tomcat-webapps>` stands for the path to the Webapps directory of your Tomcat server, e.g.: `C:\Program Files\Apache Software Foundation\Tomcat 8.5\webapps` (Windows) or `/var/lib/tomcat8/webapps` (Linux).

Setting-up the Solr-Cores

Create the following directory:

```
/opt/bluespice/data (Linux)
C:\BlueSpice\bluespice_data (Windows)
```

Move the directory "solr" from `<installpath-bluespice>/extensions/BlueSpiceExtensions /ExtendedSearch/webservices` to the just created directory.

Switch to this directory and go to the subfolder bluespice/conf/lang. Choose stopwords_<LANG>.txt there, which matches your language and replace the file stopwords.txt in the folder bluespice/conf (one level higher) with this file.

```
With Linux, please transfer the folder /opt/bluespice/data/solr recursively to the user and group, under which the Tomcat server is running.
```
Configuring Tomcat

The Tomcat server needs to know the directory to the Solr core. The following describes how to configure this.

**Linux**

The distributions differ at this point regarding the configuration file. How this needs to be configured with the distribution you are using can be found in the documentation of the distributor. The following steps explain the configuration using Debian/Ubuntu and Tomcat 8:

Open the file `/etc/default/tomcat8` and add the following line at the end:

```
JAVA_OPTS="${JAVA_OPTS} -Dsolr.solr.home=/opt/bluespice/data/solr"
```

Save the changes and exit the file.

**Windows**

Open the configuration interface of Tomcat and switch to the tab "Java". At the field "Java Options", add this as the last point in the line:

```
-Dsolr.solr.home=C:\BlueSpice\bluespice_data\solr
```

Save this settings by clicking at "Apply".

**Copying of the Solr Application**

Move the file "solr.war" from the directory `<installpath-bluespice>/extensions/BlueSpiceExtensions/ExtendedSearch/webservices` to `<tomcat-webapps>`

**Restarting Tomcat**

Restart the Tomcat Webserver like described here.
Activating the Extended Search in BlueSpice

Go to the directory `<installpath-bluespice>/extensions/BlueSpiceExtensions`. If the file `BlueSpiceExtensions.local.php` does not exist already, please copy the file `BlueSpiceExtensions.default.php` and paste it in the folder. Rename it to `BlueSpiceExtensions.local.php`. Open this file in a text editor.

Scroll to the end of the file. There you can find the following line:

```
#require_once( __DIR__.'/ExtendedSearch/ExtendedSearch.setup.php" );
```

Delete the first character (`#`), save and exit the file.

Open a command line and change to the directory `<installpath-bluespice>`. Run the following command there:

```
php maintenance/update.php
```

With Windows, please take care that the environment variables are set correctly to access the command "php".

With Linux, please take care that after running the update.php, the file system permissions must be set again.

As soon as the script finished its work with the message "Done", run a further maintenance script to create the search index:

```
php extensions/BlueSpiceExtensions/ExtendedSearch/maintenance/searchUpdate.php
```

Running this script may take some time. This depends on the amount of content, which has been created in the wiki. When the script was completely executed, the extended search is installed successfully and is ready to use.
This document describes the installation of BlueSpice - PDF export. Please make sure that the Apache Tomcat server is completely installed and configured at the BlueSpice server.

Tips for this Document

- Please, read this manual completely and work through the single installation steps one after another.
- For editing the configuration files with a text editor, the files must be saved in UTF-8 coding without BOM (Byte Order Mark).
- The placeholder <installpath-bluespice> stands for the path to your BlueSpice installation, e.g C:\inetpub\wwwroot\bluespice (Windows) or /var/www/bluespice (Linux).
- The placeholder <tomcat-webapps> stands for the path to the Webapps directory of your Tomcat server, e.g. C:\Program Files\Apache Software Foundation\Tomcat 8.5\webapps (Windows) or /var/lib/tomcat8/webapps (Linux).

Copying the BShtml2PDF Application

Move the file "BShtml2PDF.war" from the directory <installpath-bluespice>/extensions/BlueSpiceExtensions/UEModulePDF/webservices to <tomcat-webapps>

Restart Tomcat

Restart the Tomcat Webserver like described here.

Activating the PDF Export in BlueSpice

Go to the directory <installpath-bluespice>/extensions/BlueSpiceExtensions. If the file BlueSpiceExtensions.local.php does not exist already, please copy the file BlueSpiceExtensions.default.php and place it in the same folder under the name BlueSpiceExtensions.local.php. Open this file in a text editor.

Scroll to the end of the file. You will find the following lines there:

```php
#require_once( __DIR__."/UniversalExport/UniversalExport.setup.php" );
#require_once( __DIR__."/UEModulePDF/UEModulePDF.setup.php" );
```
Remove the first character (#), save the file and exit it.

Open a command line and change to the `<installpath-bluespice>` folder. Execute the following command:

```
php maintenance/update.php (Linux)
php maintenance\update.php (Windows)
```

In Windows, make sure that the environment variables are set correctly to access the `php` command.

Note that you must update the file system permissions after running `update.php`.

When the script is finished with the "Done" message, the web service is successfully installed.
Troubleshooting

If there is a problem with PDF export in BlueSpice, first check the file system permissions.
2.3. VisualDiff (BlueSpice pro only)

This document describes the installation of VisualDiff from BlueSpice. **VisualDiff is a exclusive component of BlueSpice pro!** Please note that the Apache Tomcat server must be installed and configured on the BlueSpice server.

**Tips for this Document**

- Please, read this manual completely and work through the single installation steps one after another.
- For editing the configuration files with a text editor, the files must be saved in UTF-8 coding without BOM (Byte Order Mark).
- The placeholder `<installpath-bluespice>` stands for the path to your BlueSpice installation, e.g. C:\inetpub\wwwroot\bluespice (Windows) or /var/www/bluespice (Linux).
- The placeholder `<tomcat-webapps>` stands for the path to the Webapps directory of your Tomcat server, e.g. C:\Program Files\Apache Software Foundation\Tomcat_8.5\webapps (Windows) or /var/lib/tomcat8/webapps (Linux).

**Copy of BShtmdiff**

Move the file "BShtmDiff.war" from the directory `<installpath-bluespice>/extensions/BlueSpiceVisualDiff/VisualDiff/webservices` to `<tomcat-webapps>`

**Restart Tomcat**

Restart the Tomcat Webserver like described [here](#).

*This completes the installation of VisualDiff.*

**Troubleshooting**

If there is a problem with VisualDiff in BlueSpice, first check the file system permissions.
This document describes the installation of LatexRenderer from BlueSpice. **LatexRenderer is a exclusive component of BlueSpice pro!** Please note that the Apache Tomcat server must be installed and configured on the BlueSpice server.

### Tip for this Document

- Please, read this manual completely and work through the single installtion steps one after another.
- For editing the configuration files with a text editor, the files must be saved in UTF-8 coding without BOM (Byte Order Mark).
- The placeholder `<installpath-bluespice>` stands for the path to your BlueSpice installation, e.g C:\inetpub\wwwroot\bluespice (Windows) or /var/www/bluespice (Linux).
- The placeholder `<tomcat-webapps>` stands for the path to the Webapps directory of your Tomcat server, e.g. C:\Program Files\Apache Software Foundation\Tomcat 8.5\webapps (Windows) or /var/lib/tomcat8/webapps (Linux).

### Installation of the LatexRenderer application

Move the file "BSLaTeX2PNG.war" from the directory `<installpath-bluespice>/extensions` /BlueSpiceLatexRenderer/LatexRenderer/webservices to `<tomcat-webapps>`

### Restart Tomcat

Restart the Tomcat Webserver like described here.

**This already completes the installation of LatexRenderer.**

### Troubleshooting

If there is a problem with LatexRenderer in BlueSpice, first check the file system permissions.
3. Additional settings and optimization

- Caching
- Cronjobs
- Time zone
This document describes different caching options to enhance the performance of your BlueSpice installation.

**Tips for the Document**

- Please, read this manual completely and work through the single installation steps one after another.
- For editing the configuration files with a text editor, the files must be saved in UTF-8 coding without BOM (Byte Order Mark).
- The placeholder `<installpath-bluespice>` stands for the path to your BlueSpice installation, e.g. C:\inetpub\wwwroot\bluespice (Windows) or /var/www/bluespice (Linux).

**Linux vs. Windows**

Please note that with equal hardware conditions, BlueSpice empirically runs more performantly on Linux than on Windows servers.

**Indicate Cache-Directory**

This forces BlueSpice to use the filesystem instead of the database for some internal caches. To do this, create the file `<installpath-bluespice>/settings.d/001-Directories.php` and add the following content:

```php
<?php
$wgCacheDirectory = "$IP/cache";
```

Save and close the file.

*Note that the directory "cache" in `<installpath-bluespice>` must be writable by the web server. For more information, read the file system permissions.*
Name Resolution of the Database

If this hasn't already been done while setting up MediaWiki, please make sure that the database server will be addressed via IP if it runs on the same server than BlueSpice. Especially Windows has problems with the resolution of "localhost".

To do this, open <installpath-bluespice>/LocalSettings.php and locate the variable $wgDBserver. The line should ideally be:

```
$wgDBserver = "127.0.0.1";
```

Activate Memcached

Create the file <installpath-bluespice>/settings.d/001-Memcached.php and add the following content:

```php
<?php
$wgMainCacheType = CACHE_MEMCACHED;
$wgSessionCacheType = CACHE_DB;
$wgMemCachedServers = [ "127.0.0.1:11211" ];
```

Save and close the file.

The prerequisite is an installed and configured memcached server on the BlueSpice server. Read the memcached article for more information.

Increase PHP Memory Limit

A higher memory limit of PHP results in a faster execution. This can be changed in php.ini. Locate and adjust the following option:

```
memory_limit = 512M (means 512 MB - varies from the available memory)
```

After saving and closing php.ini, the web server must be restarted.

Activate Bytecode Cache in PHP

Since PHP 5.5 the bytecode cache "opcache" is included.

This needs to be activated in the php.ini first. Check if the module is integrated there. This is done via the line:

```
zend_extension=opcache.dll (Windows)
zend_extension=opcache.so (Linux)
```
Please also note the specification of the distributor for activating PHP modules under Linux.

Please, do the following configuration of the opcache in php.ini. Normally, all options should already exist, but are commented out by semicolon (;) at the beginning of the line. Locate the respective option in php.ini, remove the semicolon at the beginning of the line and adjust the settings as follows:

```
opcache.enable=1
opcachememory_consumption=512 (means 512 MB - varies from the available memory)
opcache.max_accelerated_files=5000
opcachetimestamps=1
opcacherevalidate_freq=2
```

After saving and closing php.ini, the web server must be restarted.

Deactivate JobQueue

For this, read the paragraph "runJobs.php" in the "Cronjobs" article.
3.2. Cronjobs

This document describes cronjobs and related configurations, which should be set for your BlueSpice (depending on the used version).

Tips for this Document

- Please, read this manual completely and work through the single installation steps one after another.
- For editing the configuration files with a text editor, the files must be saved in UTF-8 coding without BOM (Byte Order Mark).
- The placeholder `<installpath-bluespice>` stands for the path to your BlueSpice installation, e.g., C:`/inetpub/wwwroot/bluespice` (Windows) or `/var/www/bluespice` (Linux).

**runJobs.php**

Time-consuming processes will be moved to a processing queue in the background of BlueSpice. With every page impression, a part of these will be processed. For the case that there are lots of processes in the queue and there are relatively little page impressions, the tasks will not be processed promptly.

For this reason, the queue should be processed regularly by cronjob.

Now create a cronjob (Windows: "Scheduled task") depending on your operating system. The command to execute is:

```bash
php <installpath-bluespice>/maintenance/runJobs.php (Linux)
php.exe <installpath-bluespice>\maintenance\runJobs.php (Windows)
```

It is recommended to specify the complete path to php.exe under Windows. For more information, see the environment variables document.

Execute the cronjob every **15 minutes**.

**processBsEmailBatch.php**

For reports via email sent from MediaWiki, please create a cronjob and run it daily. The command for this is:

```bash
php <installpath-bluespice>/extensions/BlueSpiceEchoConnector/maintenance/processBsEmailBatch.php (Linux)
php.exe <installpath-bluespice>\extensions\BlueSpiceEchoConnector\maintenance\processBsEmailBatch.php (Windows)
```
It is recommended to specify the complete path to php.exe under Windows. For more information, see the environment variables document.

runNotifications.php (only BlueSpice pro)

The BlueSpiceReminder notifies the users by email about upcoming tasks in BlueSpice. For this, a cronjob needs to be executed once a day. This is the command:

```bash
php <installpath-bluespice>/extensions/BlueSpiceReminder/Reminder/maintenance/runNotifications.php
```

It is recommended to specify the complete path to php.exe under Windows. For more information, see the environment variables document.
3.3. Time zone

Even if every user can change his time zone himself in the user settings, BlueSpice sets the default time zone "Europe/Berlin" when the user first logs in. This document describes how to change this if necessary.

Tips for this Document

- Please, read this manual completely and work through the single installation steps one after another.
- For editing the configuration files with a text editor, the files must be saved in UTF-8 coding without BOM (Byte Order Mark).
- The placeholder `<installpath-bluespice>` stands for the path to your BlueSpice installation, e.g C:\inetpub\wwwroot\bluespice (Windows) or /var/www/bluespice (Linux).

Changing the Time Zone

Open the file `<installpath-bluespice>/settings.d/001-DefaultSettings.php`. In delivery stat, you can find these two lines there:

```php
$wgLocaltimezone = 'Europe/Berlin';
$wgDefaultUserOptions['timecorrection'] = 'ZoneInfo|'.(date('I') ? 120 : 60).'|Europe/
```

Replace "Europe / Berlin" with your time zone. An overview of all possible time zones can be found in the [official PHP documentation](https://www.php.net/timezones).

Save and close the file.
4. Further system configuration

- Environment variables (Windows)
- Apache Tomcat
- Memcached
4.1. Apache Tomcat

This document describes the configuration of the Apache Tomcat server, which is needed for the Webservices of BlueSpice.

Installation

Linux

Install the latest version of the Apache Tomcat server in the package manager of your distribution. The package manager dissolves all dependencies and installs the required packages.

Windows

Java

Apache Tomcat requires the Java Runtime Environment. If these is not already installed at your system, download (www.java.com) and install it. We recommend the 64 bit version for latest systems.
Tomcat

Download the “32-bit/64-bit Windows Service Installer” from the Tomcat project website. No modifications are necessary during the installation process. Confirm the single steps with “Next”.

Installation Check

If the Apache Tomcat server has been installed and started correctly can be checked by calling up http://<host name-or-ip-of-the-server>:8080. With a correct installation, the default page of the server will be displayed.

Configuration

Now, two configuration files of the Tomcat server need to be adjusted:

- context.xml
- server.xml

Those can - per default - be found at:

- with Windows: C:\Program Files\Apache Software Foundation\Tomcat 8.5\conf
- with Linux: /etc/tomcatX (the "X" stands for the particular Tomcat version)

context.xml

Replace the line

<context>

with

<Context mapperContextRootRedirectEnabled="true">
server.xml

Please make sure that the complete block

```xml
<Connector port="8080" protocol="HTTP/1.1"
    connectionTimeout="20000"
    URIEncoding="UTF-8"
    redirectPort="8443"
    address="127.0.0.1" />
```

is as follows:

```xml
<Connector port="8080" protocol="HTTP/1.1"
    connectionTimeout="20000"
    URIEncoding="UTF-8"
    redirectPort="8443"
    address="127.0.0.1" />
```

Restart Tomcat

Restart the Tomcat server:

- **Linux**: `service tomcatX restart` (the "X" stands for the particular Tomcat version)
- **Windows**: See below: Restart Tomcat

Special features under Windows

Configure Tomcat

All of the following settings need to be done in the configuration interface of Tomcat. These can be found in the start menu under "Configure Tomcat".

Restart Tomcat

The restart can be performed in the first tab of the configuration interface. Stop and then start the service there.
Setup Autostart

Tomcat will not automatically be started with Windows. This needs to be configured in the first tab, where you also start the service. Switch to "Automatic" under "Startup type" and save this changes with a click on "Apply".

Particular Caution: Java Update

Tomcat requires Java. The path for this is firmly defined in Tomcat. Java, however, changes the installation path with every update. Those needs to be configured in Tomcat after every update to guarantee the functionality of Tomcat.

To do this, switch to the tab "Java" and change the path to jvm.dll under "Java Virtual Machine" - normally this is C:\Program Files\Java\bin\server\jvm.dll.
4.2. Memcached

This document describes how to set up the memcached server, with which you can achieve some speed optimization. For the configuration of BlueSpice, also read the paragraph "Activate Memcached" in the "Caching" article.

Tips for this Document

- Please, read this manual completely and work through the single installation steps one after another.
- For editing the configuration files with a text editor, the files must be saved in UTF-8 coding without BOM (Byte Order Mark).

Linux

Installation

Install the memcached server in the package manager of your distribution.

Configuration

Open the file that contains the memcached configuration (for example, /etc/memcached.conf under Debian / Ubuntu). Locate the -m argument and increase the amount of memory available depending on the capabilities of your server:

```
- m 1024
```

Save and close the file, and restart memcached.
Check the Server

Verify that the memcached server is running:

```
netstat -tulpn | grep 11211
```

If you receive an output that is similar to this, memcached has started successfully:

```
root@bluespice:/var/www/bluespice# netstat -tulpn | grep 11211
udp 0 0 127.0.0.1:11211 0.0.0.0:* LISTEN 15163/memcached
root@bluespice:/var/www/bluespice#
```

Windows

The use of Nick Pirocanac's MemCacheD Manager is highly recommended. This makes the configuration very simple.

Requirements

An installed .NET Framework version 3.5 is required for the MemCacheD Manager.

Download

Download the MemCacheD Manager from software.informer.com.

Installation

During the installation you have hardly any setting possibilities, so you can "click" through the installation process without any changes.

Starting the MemCacheD Manager

Always start the MemCacheD Manager from the start menu as administrator (right click -> Run as administrator)!
Configuration

1. In MemCacheD Manager, click "Add Server"
2. Enter the local IP "127.0.0.1" under "Server Name" and click on "Apply"
3. Click "Add Instance"
4. Enter any desired name under "Instance Name"
5. Under Maximum Memory, increase the available memory depending on the capabilities of your server
6. Click "Apply"
7. Start the new created instance by clicking on "Yes"

The Memcached Server is now installed and configured.
4.3. Improve speed performance

BlueSpice is optimized for fast read accesses. If your BlueSpice is running slowly, it can have different reasons. Often the search engine is not set up or the corresponding Tomcat server is not available. Also, an incorrect configuration (e.g., caches) may be the cause. Or the performance of your server is too low.

In this Howto you will find the most important solutions for increasing the speed of your BlueSpice instance.

Apache Tomcat Server not available

BlueSpice uses the search engine Apache Lucene / Solr, which supports important services of the wiki. Should saving a page take a long time, this is an indication that you have a problem with the search engine. Or you can simply enter a search query: If the input and the search page does not look as described here, the search engine is not installed correctly.

- Please check the Installation manual to see if you have completed the installation.
- Restart the Apache Tomcat Server.

Specify cache directory

When you specify a cache directory, the Wiki uses the filesystem for some internal caches instead of the database

```
## Set $wgCacheDirectory to a writable directory on the web server
## to make your wiki go slightly faster. The directory should not
## be publically accessible from the web.
$wgCacheDirectory = "$IP/cache";
```

Please make sure that the folder named here can be described by your web server. See also the notes in the Installation manual.

## Resize the name resolution of the database server

Especially under Windows, the name resolution of "localhost" can lead to delays. Use the IP address instead of the DNS name in the database. To do this, change the server configuration accordingly in LocalSettings.php:

```php
$wgDBserver = "127.0.0.1"; # change IP value to your DB server IP
```

## Enable memcached

Use Memcached as the central cache type. Note that Memcached must be installed and active on the server!

To do this in LocalSettings.php insert this configuration at the end:

```php
$wgMainCacheType = CACHE_MEMCACHED;
$wgMemCachedServers = array("127.0.0.1:11233");
```

## Enable Bytecode Cache in PHP

Since PHP 5.5, the bytecode cache opcache is delivered with. This must however be activated in the php.ini:

```ini
opcache.enable=1
```

Additional settings:

```ini
opcache.memory_consumption=512
opcache.max_accelerated_files=10000
opcache.validate_timestamps=1
opcache.revalidate_freq=2
```

After changing the php.ini, the web server must be restarted.

## Increase PHP Memory Limit

A higher memory limit of PHP results in a faster execution. This must be specified in php.ini:

```ini
memory_limit = 256M
```

After changing the php.ini, the web server must be restarted.
Set up JobQueue

Some tasks from MediaWiki can be delayed. Typically, they are processed by calling pages on the wiki. This can lead to delays. To prevent this, the JobQueue must be set up. Create a cronjob or task that runs this script every 10 minutes:

```bash
php maintenance/runJobs.php --maxjobs 100
```

Renew the L10N cache

Only in the case of absolute emergency, you can manually update the local cache, otherwise it will be rewritten every page call. To do this in LocalSettings.php insert this configuration at the end:

```php
$wgLocalisationCacheConf['manualRecache'] = true;
```

Then execute the following command:

```bash
php /maintenance/rebuildLocalisationCache.php --force --lang="de,de-formal,en"
```

This command should also be set up as an hourly cronjob.

Learn more: https://www.mediawiki.org/wiki/Manual:$wgLocalisationCacheConf
4.4. Environment variables

For using console commands for PHP ans MySQL in a comfortable way, some settings in the environment variables should be done. This document describes how to do this.

**Tips for this Document**

- Please, read this manual completely and work through the single installation steps one after another.

**Figure out Paths**

Please try to figure out in which paths of your Windows installation the following files are located:

- php.exe
- mysql.exe

This document uses this paths as **an example** for the description:

- C:\Program Files (x86)\PHP\php-5.6.30\php.exe
- C:\Program Files\MariaDB 10.1\bin\mysql.exe

**Enter Environmental Variables**

1. Press the key combination "Windows + R" to start the input request
2. Start the program "SystemPropertiesAdvanced.exe"
3. Click at "Environment Variables"

4. Open the variable "Path" at "System variables" with a double click
5. With Windows 2012: In the line "Value of Variables", add the paths to php.exe and mysql.exe, separated by semicolon, directly at the beginning of the line. Regarding the path example, this would be "C:\Program Files (x86)\PHP\php-5.6.30;C:\Program Files\MariaDB 10.1\bin;".

6. Windows 2016 and above: Add two new entries with their respective pathnames.

7. Close all windows by clicking on "OK".
8. Restart the command line.

Now you should be able to call up the commands "php" and "mysql" without problems in the command line.
5. Security settings

- File System Permissions
- Deactivating installcheck file
- Save Directories
5.1. Deactivating installcheck file

As soon as the setup of BlueSpice is completed, you should prevent the execution of the installcheck.php while using the wiki productively. A short instruction can be found in this document.

Tips for this Document

- Please, read this manual completely and work through the single installation steps one after another.
- For editing the configuration files with a text editor, the files must be saved in UTF-8 coding without BOM (Byte Order Mark).
- The placeholder <installpath-bluespice> stands for the path to your BlueSpice installation, e.g. C:\inetpub\wwwroot\bluespice (Windows) or /var/www/bluespice (Linux).

Deactivating installcheck.php

Switch to the directory <installpath-bluespice> and open the installcheck.php file in a text editor. Insert a new line after the first line and insert

```
  die( 'Deactivated.' );
```

Save and exit the file. The installcheck.php is no longer accessible now. If you need to restore this file at a later time, it is sufficient to temporarily disable inserted line by placing the # character at the beginning of the line.
5.2. Save Directories

Contents

1 Tips for this Document .................................................................................................................................... 45
2 Explanation for Saving Directories ............................................................................................................ 45

Tips for this Document

- Please, read this manual completely and work through the single installation steps one after another.
- For editing the configuration files with a text editor, the files must be saved in UTF-8 coding without BOM (Byte Order Mark).
- The placeholder `<installpath-bluespice>` stands for the path to your BlueSpice installation, e.g C:\inetpub\wwwroot\bluespice (Windows) or /var/www/bluespice (Linux).

Explanation for Saving Directories

It is highly recommended, to lock several directories to save them from access from external browsers, so that calling up the directory or the content delivers the HTTP status code (Forbidden).

To find out how this works with the webserver you are using, please read the documentation of your webserver software.

The following directories should be saved:

- `<bluespice-url>/cache`
- `<bluespice-url>/images`
  Please keep in mind that you need to unblock the subfolder `<bluespice-url>/images/bluespice/flexiskin` afterwards, because this subfolder must be accessable.
- `<bluespice-url>/mw-config`
6. Advanced configuration

- Configuration Folder settings.d
- Activation and deactivation of BlueSpice-extensions
- Rebuilding the search index
6.1. Configuration Folder settings.d

Tip for theDocument

- Please, read this manual completely and work through the single installation steps one after another.
- For editing the configuration files with a text editor, the files must be saved in UTF-8 coding without BOM (Byte Order Mark).
- The placeholder <installpath-bluespice> stands for the path to your BlueSpice installation, e.g C:\inetpub\wwwroot\bluespice (Windows) or /var/www/bluespice (Linux).

This document provides background information for advanced users. We recommend not to make any changes on BlueSpice, if you are not familiar with the following information.

Explanation For the Folder settings.d

Starting with BlueSpice version 2.27.1, all default settings as well as the modules of BlueSpice are outsourced. All configurations can now be found in separate files in the /settings.d folder.

The files in this folder integrate the standard MediaWiki extensions required for BlueSpice, perform recommended default configurations, and also integrate all BlueSpice-related extensions (free or pro).

The files in the /settings.d folder are automatically integrated in alphabetical order and are therefore prefixed with numbers.

If you want to add additional configurations yourself, you can save your own files here. For this, it is recommended to use the prefix 001-.

Additional configurations, which are not packed per default but can be used, can be found at auf github.com.
6.2. Activation and deactivation of BlueSpice extensions

**Contents**

1. Tips for this Document ................................................................. 48
2. Create a configuration file which will be not overriten while you update BlueSpice ............................................ 48
3. Deactivation of extensions .......................................................... 48
4. Activation of extensions .............................................................. 48

In some cases you could need the possibility to activate or deactivate single extensions of BlueSpice. This document will show you how to do this.

**Tips for this Document**

- Please, read this manual completely and work through the single installation steps one after another.
- For editing the configuration files with a text editor, the files must be saved in UTF-8 coding without BOM (Byte Order Mark).
- The placeholder `<installpath-bluespice>` stands for the path to your BlueSpice installation, e.g C: \inetpub\wwwroot\bluespice (Windows) or /var/www/bluespice (Linux).

**Create a configuration file which will be not overriten while you update BlueSpice**

All BlueSpice-extensions are configured in the file `<installpath-bluespice>/extensions/BlueSpiceExtensions/BlueSpiceExtensions.default.php` by default. You should not use this file to configure these extensions because it will be overwritten while you update BlueSpice. Copy this file to `<installpath-bluespice>/extensions/BlueSpiceExtensions/BlueSpiceExtensions.local.php` and do all changes in this file.

**Deactivation of extensions**

Search the relevant extension in `<installpath-bluespice>/extensions/BlueSpiceExtensions` /BlueSpiceExtensions.local.php. Uncomment the line which includes the extension by typing `//` at the beginning of the line.

**Activation of extensions**

If you which to activate extensions which are deactivated please search the relevant extension in `<installpath-bluespice>/extensions/BlueSpiceExtensions/BlueSpiceExtensions.local.php`. Remove the commentation at the beginning of the line (`#` or `//`).

After that open a command line and switch to the folder `<installpath-bluespice>`. Execute the following command:

```bash
php maintenance/update.php (Linux)
```
With Windows, please take care that the environment variables are set correctly to access the php command.

With Linux, please keep in mind that after running the update.php, the file system permissions need to be adjusted again.

When the script is finished with the "Done" message, proceed to the next step.
...event_agent field does not exist in echo_event table, skipping modify field patch.

Checking existence of old default messages...done.
Populating rev_len column
...doing rev_id from 1 to 200
Populating ar_len column
...archive table seems to be empty.
rev_len and ar_len population complete [0 revision rows, 0 archive rows].
Populating rev_sha1 column
...doing rev_id from 1 to 200
Populating ar_sha1 column
...archive table seems to be empty.
Populating ar_sha1 column legacy rows
rev_sha1 and ar_sha1 population complete [0 revision rows, 0 archive rows].
Populating img_sha1 field

Done 0 files in 0.0 seconds
Fixing protocol-relative entries in the externallinks table...
Done, 0 rows updated.
Populating fa_sha1 field from fa_storage_key

Done 0 files in 0.0 seconds
Updating * from namespace fields in links tables.
...doing page_id from 1 to 200
Purging caches...done.

Done in 1.6 s.
6.3. Rebuilding the search index

In some cases it is needed to rebuild the search index. This document will show you the steps to do this.

Tips for this Document

- Please, read this manual completely and work through the single installation steps one after another.
- The placeholder `<installpath-bluespice>` stands for the path to your BlueSpice installation, e.g C:\inetpub\wwwroot\bluespice (Windows) or /var/www/bluespice (Linux).

Rebuilding the search index

Please open a command line on your system and change to `<installpath-bluespice>`. Execute the following command:

```
php extensions/BlueSpiceExtensions/ExtendedSearch/maintenance/searchUpdate.php (Linux)
php extensions\BlueSpiceExtensions\ExtendedSearch\maintenance\searchUpdate.php (Windows)
```

With Windows, please take care that the environment variables are set correctly to access the php command.

Depending on the size of your contents and uploads this can take a while.
The MediaWiki-extensions SyntaxHighlight_GeSHi is not running correctly in some cases of setups. This document will show you how to configure your system environment that you can use the extension.

Tips for this Document

- Please, read this manual completely and work through the single installation steps one after another.
- For editing the configuration files with a text editor, the files must be saved in UTF-8 coding without BOM (Byte Order Mark).
- The placeholder `<installpath-bluespice>` stands for the path to your BlueSpice installation, e.g C:\inetpub\wwwroot\bluespice (Windows) or /var/www/bluespice (Linux).

SyntaxHighlight_GeSHi and Linux

If you are using Linux as BlueSpice server it's enough make two files executable (`chmod 755`):

```
<installpath-bluespice>/extensions/SyntaxHighlight_GeSHi/pygments/create_pygmentize_bundle
<installpath-bluespice>/extensions/SyntaxHighlight_GeSHi/pygments/pygmentize
```

For more information please refer to the article "File System Permissions".

SyntaxHighlight_GeSHi and Windows

First, please install latest version of Python 2.7.x. It is recommended to use the standard installation path (C:\Python27).

After that please open your windows command line and change to the subfolder "Scripts" in the Python installation path. Install the needed package "pygments" by using this command:

```
pip.exe install pygments
```

Now tell your BlueSpice installation where the pygmentize.exe can be found by setup this variable in your LocalSettings.php:

```
$wgPygmentizePath = "c:\Python27\Scripts\pygmentize.exe";
```
At the end please take care that the temporary directory of your PHP installation (default: C:\Windows\Temp) is fully writable by your webserver.

With these steps your should have a working system setup to use the SyntaxHighlight_GeSHi without problem.
